Dabrowski S. Plastic Material for Covering the Draft Rolls of Spinning Machines.

„Zastosowanie pokryć z mas plastycznych na walki zwiększające maszyn przedziałniczych”. Przemysł Więkkenniczy. No. 3—6. 1953. pp. 139—141, No. 7—8. 1953. pp. 181—184, 17 figs., 3 tabs.

Description of the process, hitherto practised in the textile industry, of covering the upper draft rolls of spinning machines with cloth or leather. The author substantiates, on the basis of indices for the quality of work of draft rolls, the necessity for covering the rolls with plastic material. He provides a detailed review of the influence of the coefficient of friction of the substance used for covering the draft rolls on the drafting process and the quality of the product obtained. He proves, on the basis of experiments, the improvement in the quality of the product resulting from the use of plastic materials for covering the rolls. The author also deals with the technique of making hoses from plastic polyvinyl chloride, with the process of using this plastic to cover the rolls, and also with the method of finishing the surface of the covers.

✓ Animal corynebacteria, with particular reference to *Corynebacterium equi*. J. Parman, T. Dabrowski, S. Stepkowski, Z. Lorkiewicz, and T. Mierzejewski. *Zeszyty Nauk. M. Curyla-Skłodowska*, 1952, 7, 209-382).—This detailed monograph includes bacteriology, serology, immuno-chemistry, and epizootiology. The described characteristics of the different corynebacteria have been investigated. The causative agent of dangerous pyoanullosis in foals, *C. equi*, has been studied in great detail and recommendations for treating the disease include use of streptomycin, vaccines III and Camphochin. A recommendation of early and frequent vaccination of foals is given. Included R.M. photographs show that *C. equi* has a capsule and the bacteriophage of *C. equi* is established if exhibits a prophylactic action in experiments. Twenty collected strains have an identical species-group antigen and a type-specific one. An antigenic heterogeneity is present among the strains of *C. pyogenes*. *C. pyogenes hominum* is closely antigenic to *C. pyogenes bovis*, indicating the possibility of the transfer of infection from bovines to man.

"Laboratory Diagnosis of Emphysematous Gangrene"

Lublin, Medycyna Weterynaryjna, Vol 22, No 5, pp 267-270

Abstract: A bacteriological examination was made of 23 cases of emphysema-tosis gangrene in cattle. A relatively fast and easy way of separating the bacteria is presented. A method is given for isolating pure broth cultures of Cl. chanvoei, which was identified by morphological, culture, biochemical and biological tests.

Abstract: Increased production, processing, and domestic and export consumption of venison, and particularly of rabbits and nutria brings to the fore the necessary sanitary measures, not as yet covered by government regulations or experience, and made particularly difficult in view of the lack of even elementary textbooks on the diseases of these animals in the Polish language. The author discusses procedures of inspection and preservation, which he deems particularly timely in view of the pending drafting of legislation on the subject by the committee created for the purpose by the Ministry of Agriculture. There are no references.

Influence of anti-smallpox vaccination on the course of pregnancy POL. TYG. LEK. 1956, 11/52 (2183-2188) Graphs 1 Tables 4

Anti-smallpox vaccination as a viral infection may cause complications in the mother as well as in the foetus. In the spring of 1953 mass vaccination of the adult population was undertaken. 1,270 pregnant women were vaccinated with the vaccinia virus and 3,515 formed the control group. A harmful effect of anti-smallpox vaccination on the course of pregnancy in its early stages was observed and this was manifested by an almost threefold increase of the frequency of abortions in comparison with the control group. The anti-smallpox vaccination had no injurious effect on the pregnancy above the 16th week. Post-vaccination abortion occurs no sooner than 4 weeks after the vaccination and not later than 12 weeks after it. The pregnancies, however, which began 4 weeks after vaccination, had a normal course. After the vaccination no increase in congenital malformations was seen.

Warsaw, Roczniki Chemii, Vol 40, No 2, 1966, pp 317 - 320

Abstract (Authors' English summary): The preparation of substituted quinolizidones-4 is described. Ethyl esters of α -2-pyridylpropionic acid, 5-methylpyridyl-2-acetic acid and α -5-methylpyridyl-2-propionic acid were cyanethylated; the resultant glutaric acid derivatives were hydrolyzed and selectively decarboxylated. After catalytic hydrogenation and thermal cyclization, 1-methyl-, 7-methyl-, and 1,7-dimethylquinolizidones-4 were obtained. Orig. art. has: 1 formula. [JPRS: 36,002]

Dabrowski Z., Flak S. Precasting of Concrete Girders Posttressed by
Cables for the Warsaw Ice-Bing Grand Stand.

"Produkcja prefabrykowanych dźwigardów kablobetonowych do try-
buń sztucznego lodowiska w Warszawie". Inżynieria i Budownictwo.
No. 1, 1955, pp. 13-16, 7 figs., 4 tabs.

The authors describe all the production phases of 52 precast concrete
girders posttressed by cables. The span of the girders is 21 m. The ce-
ment brands and the quality of sand, gravel and steel used for the
concrete are enumerated, and a description is included of the manner
of preparing the reinforcements and moulding of the members, the bat-
ching and placing of the concrete, and the posttressing of the girders.
The authors point out that not basalt grit but only granite should be
used, since latter adheres better with the cement mix. They also find
it advisable to use for the cable channels sheet metal tubes with walls
0.3-0.5 mm thick instead of gas pipes. Moreover the moulds may,
without any deterioration in the surface finish of the precast units, be
lined with black sheet instead of zinked sheet.

3198. A CASE OF PANMYELOPATHIA WITH SYMPTOMATIC RETICULOENDOTHELIOSIS AFTER ANTI-SYPHILITIC TREATMENT - Przypadek uszkodzenia szpiku z objawową siatkowicą-śródbonkowicą po leczeniu przeciwkilowym - Dabski H. and Florkiewicz H. Z. I Klin. Chorób Wew.

A.M., Lublin POL. TYG. LEK. 1958, 13/44 (1735-1738) Illus. 2
A case is described in a 40-year-old woman, which appeared 7 weeks after the termination of antisyphilitic treatment (3.45 g. of neosalvarsan and 0.4 g. of metallic bismuth). All myelitic systems were damaged, and the patient's condition was very grave. The authors call attention to a considerable reticuloendothelial reaction treating it as a symptomatic reticuloendotheliosis. The patient was treated with blood transfusions (700 ml. in total), penicillin, ACTH, liver preparation and vitamins. A restoration of the normal function of the marrow was obtained. Observation during a year showed, besides inconsiderable leuco- and thrombocytopenia, a normal behaviour of the haemopoietic system.

Budapest, Orvosi Hetilap, Vol 103, No 46, 18 Nov 62, pages 2177-2180.

Abstract: [Author's summary modified] The author describes the characteristic morphological changes in the epithelial cells. His observations support the assumption that the etiopathogenesis of the two diseases is the same.

Abstract: This article states the relation between the drought resistance of the species introduced into culture and the degree of their development of the main type roots. The resistance of the forest in Veliko-Anadol' grows with an increase of oak in its composition. The elm, ash and black locust, developing a surface root system, proved to have weak drought
